CHECK BEFORE ORDER

In the following conditions, the flowmeter may not be able to deliver enough accuracy or the measurement may be unavailable.

Consult us if you have any concerns. We can arrange a trial measurement before order.

1. Liquid

- Liquid contains a large amount of bubbles (12 vol% or more, at a flow rate of 1 m/s)

For example : circulating oil

- Liquid has a turbidity of 10000 mg/L or more

For example: waste liquid, hot spring water

- Liquid contains slurry and/or solid matters (about 5 wt%)

For example: waste liquid, hot spring water

- Low Reynolds number (10000 or less)

(Flow rate of 5 m³/h, in a 100-mm diameter pipe)

*Flow rate is proportional to diameter

- Liquids that can corrode pipe inner surface

For example: chemical solutions, liquid that contains solid matters

- High viscosity liquid (kinematic viscosity of 200 mm²/s or more)

2. Pipe straight run

For accurate measurement, a certain length of straight run is required. Check if it is possible to meet the straight run requirements given in Page 4.

PRINCIPLE

Parallel 3-path measurement

By measuring the flow with three parallel paths simultaneously, and averaging them, the flowmeter obtains the flow rate with ±0.2% of rate accuracy.
