GENERAL INFORMATION

The TX800-Series are insertion turbine meters designed for use in 1-1/2" to 8" pipe. High-quality jewel bearings and precision shafts ensure long life and low friction. Available in 316 stainless steel, brass and PVC, sensor bodies are machined from solid rod for maximum low-flow performance. The TX800-Series use special fittings that ensure ease of installation and correct depth setting in the pipe.

The rotation of the turbine is detected by a non-drag Hall-effect sensor. Output is a pulse-type square wave, which can be sent long distances (up to 2,000 feet) without a transmitter. This

signal can be connected directly to Seametrics controls and displays, as well as PLC's, counters, and computer cards.

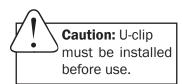

Seametrics TX800 meters are ideal for chemical proportioning applications. If no display is required, a simple divider such as the PD10 provides adjustable pump pacing. For rate and total display, as well as pump pacing, the FT420 flow indicator can be mounted directly on the TX800-Series, or remotely on a wall or panel. The FT415 offers a battery-operated rate/totalizer where power is not available.

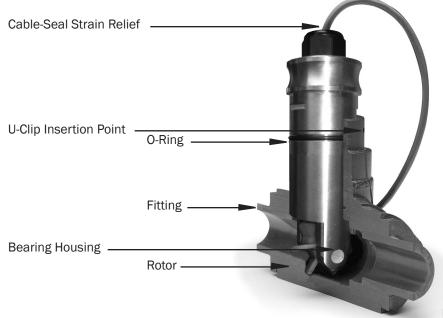

SPECIFICATIONS*

Power Source		Standard	Micropowered (-04 Option)		
Supply Voltage/Current		6-40 Vdc/< 2 mA	3.5-16 Vdc/60 μA @ 3.5 Vdc		
Sensor		Hall Effect sensor, 12 Vdc current sinking pulse			
Materials	Sensor Body	PVC, brass or stainless steel			
Rotor		PVDF (Kynar)			
Shaft		Nickel-bound tungsten carbide			
	Bearings	Ruby jewel			
	0-Ring	EPDM (Viton optional)			
Rotor Pickup		GMR (Giant Magnetoresistive) Sensor			
Maximum		Brass	316 SS	PVC (See Pressure vs. Temp. Chart)	
	Pressure	200 psi (14 bar)	200 psi (14 bar)	175 psi (12 bar) at 75°	
	High Pressure	Not Available	400 psi (28 bar)	Not Available	
Temperature		200° F (93° C)	200° F (93° C)	130° F (55° C)	
Flow Range		0.5 to 30 ft./sec. (0.15 - 9.14 meter/sec)			
Calibrated Accu	ıracy	+/- 2.5% of full scale			
Signal		Current sinking pulse, 20 mA max, 30 Vdc max (Micropower option: Pulse output swings between supply voltage and 0 Vdc)			
Power		6-30 Vdc @ 8 mA (Micropower option: 3.5-16 Vdc @ 0.3 mA max)			
Cable 22 AWG, 3 Con, 18'; 2000' max run					
Regulatory

FEATURES

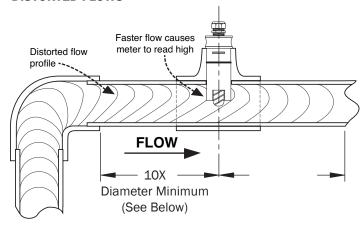

Page 1

^{**}High pressure option requires an appropriate fitting.

DISTORTED FLOWS

Fitting Installation. TX800-Series meters require special fittings. The meter fitting must first be installed in the pipeline. Straight pipe of at least ten times the diameter upstream of the meter and five diameters downstream is strongly recommended in order to achieve proper accuracy. These are minimum values. As the diagrams on the the next page will show, you may need more straight run under specific adverse circumstances.

If you can't provide enough run to smooth out the turbulence caused by valves, fittings, and changes in direction, some decrease in accuracy may result. This does not mean that the flow meter's reading is meaningless, however. In some applications (for instance, where the flow meter is part of a control system, operating a valve or controlling chemical addition), a repeatable reading may be more important than a highly accurate one.

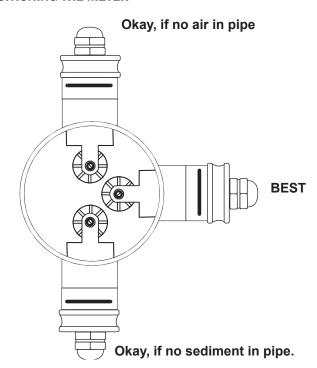

TX800-Series PVC meter tees are supplied with some upstream straight pipe. The length provided may be less than ten diameters upstream and five downstream. It is not advisable to connect directly to the end of these fittings with a flow-disturbing device such as a valve or elbow. If possible, straight pipe should be added to the upstream end of these fittings.

A PVC fitting is usually installed by solvent welding. The stainless steel and brass meter fittings have female pipe threads, requiring the appropriate male threaded fittings. Saddle fit-

tings (size 3" and above) require a hole to be cut in the pipe. The recommended hole size is 1-3/4".

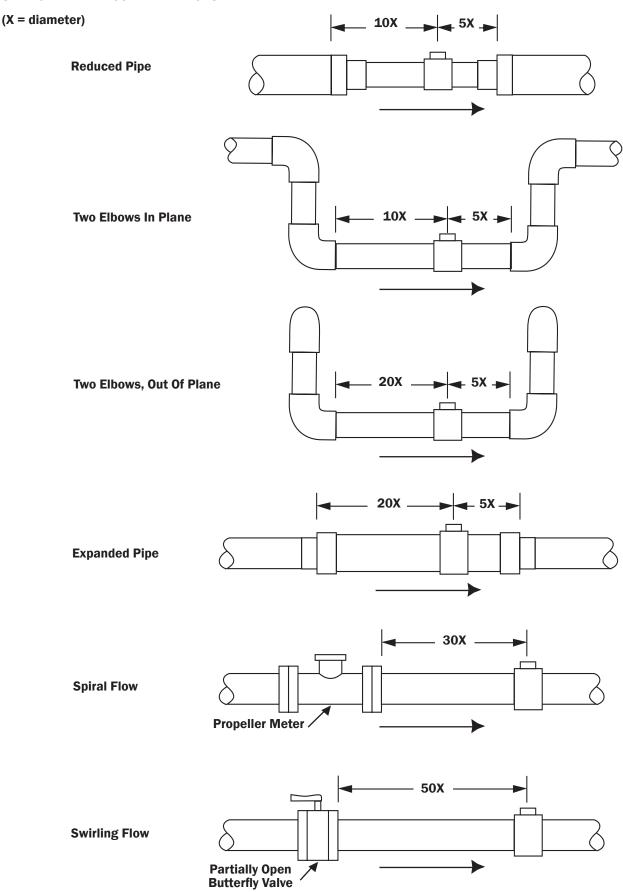

Meter Installation. After the meter fitting is installed in the pipeline, the meter can be installed in the fitting. Press the meter into the fitting as far as it will go. Retain the meter in place by inserting the u-pin. The pin can be installed from either side. It may be necessary to rotate the probe back and forth slightly to start the pin into the slots on the probe. Slide the pin in as far as it will go.

POSITIONING THE METER

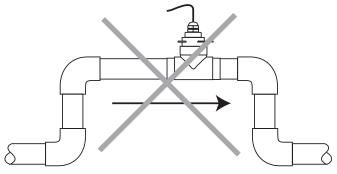

Caution: Never remove the u-clip retainer when the pipe is under pressure. Always remove pressure from the pipe before you attempt to remove the meter. Removal under pressure may result in damage or serious injury.

STRAIGHT PIPE RECOMMENDATIONS

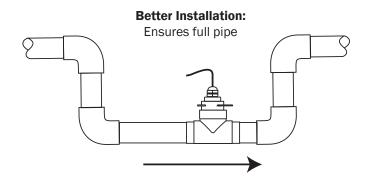

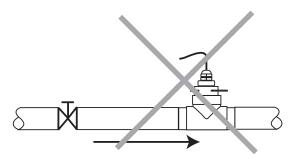

FULL PIPE RECOMMENDATIONS

Possible Problem:

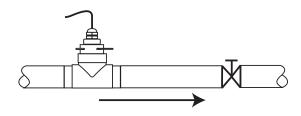

Allows air pockets to form at sensor

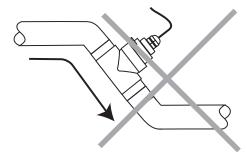

Possible Problem:

Post-valve cavitation can create air pocket

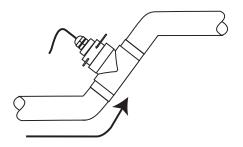

Better Installation:

Keeps pipe full at sensor

Possible Problem:

Air can be trapped

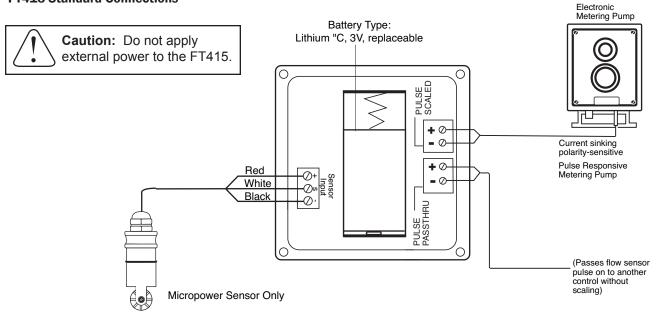

Better Installation:

Allows air to bleed off

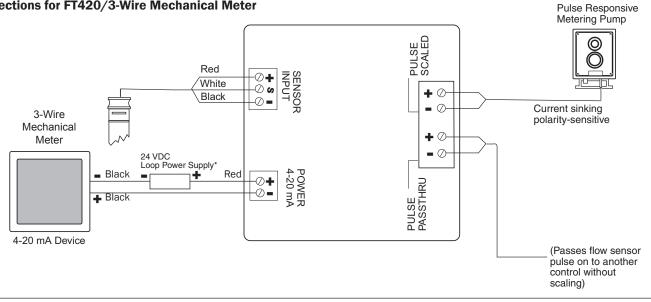

Caution: These flow sensors are not recommended for installation downstream of the boiler feedwater pump where installation fault may expose the flow sensor to boiler pressure and temperature. Maximum recommended temperature is 130°F (Plastic), 200°F (Metal).

FT415 Standard Connections

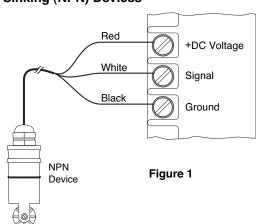

Connections for FT420/3-Wire Mechanical Meter

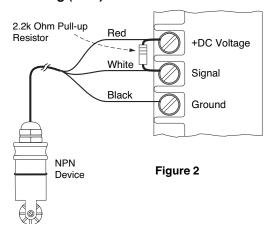

Connecting to PLC's and other non SeaMetric Controls

Input Designed for Current Sinking (NPN) Devices

Input Designed for Current Sourcing (PNP) Devices

Modularity. Any of the TX800-Series flow sensors can have electronic modules mounted directly to them, either at the time of order or by adding an adaptor kit in the field (part number 102632). Alternatively, the flow sensor and indicator or transmitter can be installed remote from each other. The FT420 is an indicating transmitter (rate, total, 4-20 mA output), and the A055 is a blind 4-20 mA transmitter. For data logging, add the DL76. The FT520, which provides batching and other functions, is suitable for remote installation.

Output. The output is a current-sinking pulse (square wave) compatible with many controls in addition to the Seametrics indicators and transmitters. The most common of these are water treatment controllers and programmable logic controllers (PLC's). For these units, it is sometimes necessary to provide a pull-up resistor if the controller does not provide for a current-sinking output. (See the section on "Connecting to PLC's and other controllers" before connecting to a non-Seametrics control.)

Fittings. Since the TX800-Series sensors are not adjustable, they must be purchased with fittings appropriate to the application. The TX810 is sized for fittings of 1 1/2" to 3". The TX820 is for fittings of 4" and 8". Each fitting insures that the flow sensor is installed at the correct point. Every flow sensor and every tee fitting is wet calibrated. Saddle fittings are normally not wet calibrated, because they are field-installed on a pipe. In PVC however it is possible to order a saddle pre-installed on a standard length of pipe, in which case the entire assembly is wet-calibrated. For all other saddles, the K-factor (pulses per gallon) is established through testing with various standard schedules of pipe and provided with the saddle.

Minimum Flow. As with any other flow sensor, there is a rate below which the TX800-Series sensor cannot read. Check the flow rate table below for the minimum flow rate detectable by the sensor for a given pipe size.

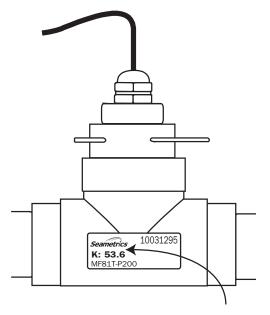

Flow Range (Gallons per Minute)

		11/2"	2"	3"	4"	6"	8"
ĺ	Min	1.1	2.1	4.6	7.9	18	31
İ	Max	190	314	691	1190	2700	4680

Flow Range (Liters per Minute)

	1½"	2"	3"	4"	6"	8"
Min	4.16	7.95	17.41	29.90	68.14	117.35
Max	719.23	1188.62	2615.72	4504.64	10220.61	17715.73

Calibration ("K-factor"). The K-factor represents the actual number of pulses per gallon the meter produces during a flow test. This number can be entered into your electronic control to make it read properly. If the TX800-Series meter is ordered with a **tee fitting**, it is factory-calibrated in the fitting and the K-factor is indicated on the side of the fitting. For saddle and weldolet K-factors, see the **K-factor calculator** located at the bottom of the **www.seametrics.com** home page.

Find Your K-Factor Here

Caution: Never remove the u-clip retainer when the pipe is under pressure. Always remove pressure from the pipe before attempting to remove the meter. Removal under pressure may result in damage or serious injury.

Rotor Replacement. It is unusual for a rotor to require replacement due to damage sustained in normal service. More commonly, the meter is dropped while it is out of the pipe. Another reason for rotor replacement is shaft wear after long service. Rotors are easily field-replaced.

To install a rotor, follow these steps:

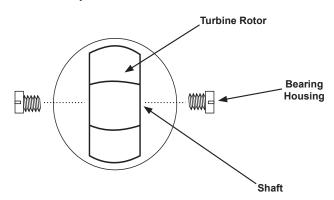

- Unscrew the threaded bearing housings to expose the shaft ends. If bearings are being replaced, back them completely out.
- 2. Remove the rotor. Put the new rotor in its place.
- 3. Thread in one bearing housing part way, then the other. Take care to start the end of the shaft into the bearing hole before tightening further.
- 4. Screw in bearing housings until they bottom. **Note: Do not use excessive force.**
- 5. Check for free spin. Blowing lightly on the rotor should result in it spinning rapidly and coasting to a smooth stop.

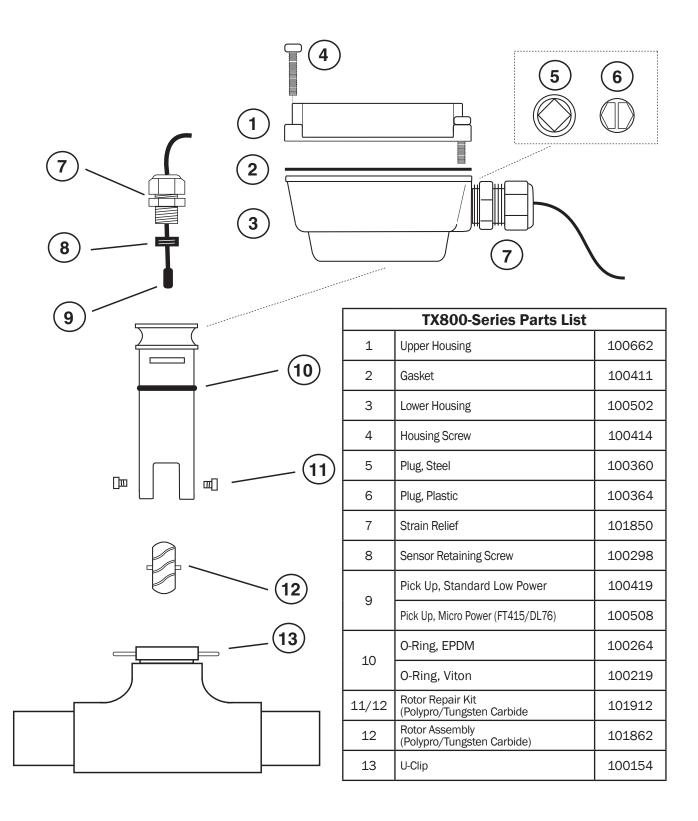

Signal Troubleshooting. The flow sensor has only one moving part, the rotor. If this is turning properly and there is no signal, the magnetic sensor is not operating properly. To check the signal, apply 12 Vdc regulated* power to the red (+) and black (-) leads. Set a multimeter to voltage reading. Put the positive multimeter lead on the red wire and the negative lead on the white wire. Slowly turn the rotor. Voltage reading should swing between +12 Volts and 0 Volts as the rotor turns. If it does not, the solid-state magnetic sensor is not working properly. Checking for continuity is not a useful test of these sensors.

*NOTE: An unregulated power supply can exceed max voltage of micro powered sensor (gray cable) and damage sensor.

Sensor Replacement. It is very unusual for a sensor to require replacement in normal use. The primary cause of sensor failure is overvoltage (inadvertent connection of line voltage, for example) or incorrect polarity on hookup. The sensor is replaced by removing the strain relief, then threading out the sensor retainer plug. Remove the entire sensor capsule by pulling on the cable. The new sensor capsule can then be installed, orientation is not critical. Replace the retainer plug, and then replace and tighten the strain relief.

Rotor Replacement

TROUBLESHOOTING

Problem	Probable Cause	Try
No signal after installation	Insufficient flow	Reduce pipe size if possible, use dif- ferent type of sensor
	Bad connections to control electronics	Reconnect if necessary
	Incompatible control	Use different power supply Add pull up resistor, (See pg. 5)
	Damaged or missing rotor	Obtain new rotor and replace (See pg. 7)
	Failed magnetic sensor	Replace magnetic sensor
Inaccurate metering	Not enough straight pipe between meter and severe flow disturbance	Move meter away from flow disturbance or field calibrate
	Wrong K-Factor entered	
	Magnetic sensor failing to pick up each blade
